

Bringing human, AI, data and robots together.

WHAT?

Flexibilization of complex Ecosystems using Democratic **AI** based Decision Support and Recommendation Systems at **Work**.

WHY?

To foster the „democratization“ of decision-making in production processes. A hybrid decision-making model takes advantage of both machine and human-centered elements. However, pairing humans with machines can be a challenge.

HOW?

Deliver a Democratic AI-based Decision Support System (DAI-DSS).

Combine model-based approaches to transparently design, simulate and improve decision making, co-creation laboratory models and physical experiments as communication media and reliable indication of data and AI algorithms.
